Education

Iowa State University

Ames, IA

○ *Masters in Computer Science, GPA – 3.92*

Present – Aug 2027

- Courses: Algorithmic Foundation, Principles of Artificial Intelligence, Principles and Practice of Compiling, Introduction to Machine Learning, Statistical Bioinformatics, Machine Learning

Skills

- **Languages** Clojure, Javascript, Python, Typescript, Clojurescript, C, SQL, Shell;
- **Frameworks** NodeJS, ReactJS, Redux, Ruby on Rails;
- **Tools & Technologies:** Docker, Kubernetes, Emacs, Git, Serverless - Aws Lambda, SQS & SNS queueing, Microservices, Grafana, Kibana, Jenkins, NumPy, Git, MongoDB, Rspec, Elastic Search, PostgreSQL, AWS, Redis, Cloudflare, Varnish - VCL, d3.JS, Adobe Photoshop, Adobe Lightroom, Figma;

Relevant Work Experience

Teamohana Inc., San Francisco

Remote

○ *Sr. Software Engineer, Founding team*

Jan 2022 – May 2025

HRIS & ATS Aggregation Platform

- Built and optimized the employee data synchronization pipeline, for seamless on boarding and regular data aggregation, from HRIS, ATS & OAuth systems providers.
- Implemented attribute-based access control (ABAC) to enhance data privacy and ensure secure and scalable authorization at user and role levels.
- Built user-management and role & user level access control configuration UI, in Clojurescript, and ReactJs.

Quintype Technologies, India Pvt. Ltd.

Bangalore, India

○ *Software Engineer*

Jan 2017 – Nov 2021

- As part of the services team: Developed a market research module for BloombergQuint (client), a leading financial news platform, which was later acquired by NDTV India.
- As a part of the platform team, we built all backend services in Clojure and the UI in Typescript and ReactJs. I worked on and managed multiple microservices, like:
 - **Bold:** CMS, rich text news editor, content management system for digital news publishers
 - **Sketches:** public content delivery API & with dynamic caching
 - **Mafia:** RSS-based, content syndication engine
 - **Quest:** Elasticsearch-based search engine
 - **Bridgekeeper:** Authentication service
- I handled multiple data migrations to onboard large customers, optimizing processes to transfer terabytes of sensitive data efficiently, and resolving bottlenecks to streamline read-write latencies in our existing systems.
- Contributed to rebuilding 'Bold' the CMS platform (news publishing editor) frontend, using Typescript, ReactJs, and NodeJs.
- Developed a self-scaling, bulk image import service using AWS Lambda, for on-ground photo journalists.
- Led a team to **design and implement our in-house Authentication service from scratch**, along with a custom SSO implementation, for multi-domain customers. Using NodeJs, JWT, OAuth, PostgreSQL and a Redis Cache. Eventually serving a billion authentications and auth-verifications per month.
- **Achievements:**
 - Recognized as the youngest engineer trusted with on-call duties & commended for mitigating critical production issues.
 - Earned early leadership opportunities as the youngest team lead, receiving appreciation for guiding and supporting peers.

Projects

- **Build a C Compiler:** Implementing lexical analysis, parsing, semantic checks, and code generation in Python with modular, testable components.
- **Heuristic Search Algorithm for CRISPR guide RNA Safety Analysis:** Implementing a heuristic search algorithm (A*) in Python to predict and rank potential CRISPR-Cas9 off-target sites in genes by calculating Hamming distance, addressing a key safety challenge for therapeutic gene editing.
- **Lisp interpreter in Ruby:** Developed an interpreter, parser, and code generation for Lisp in Ruby.

Internship Availability

Available from May 18, 2026, to August 21, 2026
